

Cricket Player Performance Tracking Application :

CRICKSTATS

3. PROJECT DESIGN

3.1 Problem-Solution Fit

The CRICKSTATS project addresses the difficulty of maintaining and analysing cricket player performance records manually. Traditional methods such as notebooks and spreadsheets can make it difficult to maintain accurate match-wise statistics and analyse player performance efficiently.

3.2 Proposed Solution

Aspect	Design
Problem	Manual maintenance of cricket player performance records can cause errors, duplication and difficulty in analysing statistics.
Solution	A Salesforce-based Cricket Player Performance Tracking Application with centralized player and match-performance records.
Innovation	Structured custom objects, custom fields, relationships, automation, reports and dashboards.
Impact	Improved accuracy, faster performance analysis and better visibility of player statistics.
Business Model	Digital cricket performance tracking and analysis platform.
Scalability	Can support multiple players, teams, matches and future performance-analysis features.

3.3 Four-Layer Architecture

Layer	Components	Purpose
1. Presentation	Salesforce Lightning UI	Provides screens for users to create, view and manage player and match records.
2. Application	Validation Rules, Relationships and automation	Applies business rules and connects related records.
3. Data	Player, Match, Match Performance and related custom objects	Stores structured cricket performance information in Salesforce Cloud.
4. Analytics	Reports and Dashboards	Converts stored match and player data into useful performance insights.

3.4 Object and Relationship Design

- Match stores information about matches such as match name, date, venue and result.
- Match Performance stores individual player performance for each match, including runs, wickets, catches and other statistics.
- Player is connected to Match Performance to maintain the performance history of each player.
- The design separates information into logical objects instead of storing all information in one large record.

3.5 Design Goals

- Maintain accurate match-wise performance data.
- Reduce duplicate and invalid data.
- Provide easy access to player statistics.
- Support reports and dashboards for performance analysis.
- Create a scalable structure for future features and advanced analytics.
