

CRICKET PLAYER PERFORMANCE TRACKING APPLICATION : CRICKSTATS

5. PROJECT DEVELOPMENT PHASE

5.1 Development Environment

The CRICKSTATS application is developed using the Salesforce platform to manage, monitor, and analyze cricket player performance. The development environment provides tools to create custom objects, define fields, manage player records, and organize performance statistics.

The application uses Salesforce Lightning Experience to provide a user-friendly interface for administrators, coaches, and users. The development process includes database configuration, object creation, field customization, security settings, and application setup.

- Development tools used:
- Salesforce Developer Environment
- Salesforce Lightning Experience
- Custom Objects and Fields
- Object Manager
- App Manager
- Profiles and Permission Sets

5.2 Custom Objects

The main custom objects used in the application are:

Player Object: Stores player details such as name, age, role, team, and player identification number.

Match Object: Stores match details such as match date, opponent team, venue, and match format.

Performance Object: Stores individual player statistics, including runs, wickets, catches, and strike rate.

Team Object: Stores team information, including team name, captain, and team details.

These objects help maintain structured records and support efficient retrieval and analysis of cricket performance data.

5.3 Player Information Management

The next step is to create fields for storing detailed information about each cricket player. These fields help the application maintain structured player records.

Important player fields can include:

Field	Type / Values
Player Name	Stores the players name
Age	Stores the players age
Team	Identifies the players team
Country	Stores the players country
Player Role	Identifies batsman bowler or all-rounder
Batting Style	Stores batting style

5.4 Match Object Development

A Match custom object can be developed to store information about cricket matches. This object helps connect player performances with specific matches.

The Match object may contain fields such as:

- Match Name
- Match Date
- Match Type
- Venue
- Team 1 □ Team 2
- Match Result
- Winning Team

Different types of matches such as T20, ODI, and Test matches can be recorded based on the requirements of the application.

The Match object helps organize match information and provides a reference for recording player performance.

5.5 Player Performance Object

A Player Performance object can be used to record the performance of players in individual matches.

The performance information may include:

- Batting Statistics
- Runs Scored
- Balls Faced
- Fours
- Sixes
- Strike Rate
- Bowling Statistics
- Overs Bowled
- Runs Conceded
- Wickets Taken
- Economy Rate
- Maidens
- Fielding Statistics
- Catches
- Run Outs
- Stumping's

These details help CRICKSTATS maintain complete performance records for each player.

5.6 Creating Tabs

Custom tabs can be created to provide easy access to the objects in the CRICKSTATS application.

Possible tabs include:

- Players
- Matches
- Player Performances

- Reports
- Dashboards

Tabs provide a simple navigation system and allow users to quickly access different sections of the application.

5.7 Lightning App Development

After creating the required objects and tabs, a dedicated CRICKSTATS Lightning App can be configured.

The application can contain navigation items such as:

CRICKSTATS

→ Players

→ Matches

→ Performance

→ Reports

→ Dashboards

The Lightning App provides a single interface through which users can access and manage cricket related information.

5.8 Security and User Permissions

Security is also considered during the development phase. Salesforce provides different methods to control access to application data.

The CRICKSTATS application can use:

- I. Profiles
- II. Permission Sets
- III. Object Permissions
- IV. Field-Level Security

V. Record-Level Access

These security features help ensure that users can access only the information and functions required for their role.
