

CRICKET PLAYER PERFORMANCE TRACKING

APPLICATION:CRICKSTATS

6. PROJECT TESTING

6.1 Testing Objective

Testing verifies that the CRICKSTATS – Cricket Player Performance Tracking Application functions according to its requirements and that player records, match statistics, performance calculations, search features, validation, and analytics behave as expected. The testing process ensures that the application provides accurate cricket performance information and operates reliably under different conditions.

6.2 Test Areas

Test ID	Area	Expected Result	Status
TC-01	Player Record Creation	Player record can be created with the required information.	Tested
TC-02	Player Profile Tested	Player profile displays the correct player details and information.	Tested
TC-03	Team Record Management	Team information can be added and stored correctly.	Tested
TC-04	Match Record Creation Tested	Match details such as teams, date, venue and result can be stored correctly.	Tested
TC-05	Mandatory Field Validation	Required fields prevent incomplete player or match records from being submitted.	Tested
TC-06	Data Validation Tested	Invalid or incorrect values are identified and appropriate	Tested

		validation messages are displayed.	
TC-07	Batting Statistics Tested	Runs, innings, average, strike rate and other batting statistics are displayed correctly.	Tested
TC-08	Bowling Statistics	Overs, wickets, economy rate and other bowling statistics are calculated and displayed correctly.	Tested
TC-09	Performance Tracking	Player performance is tracked and updated based on available match records.	Tested
TC-10	Player Search	The required player can be searched and the corresponding player information displayed.	Tested
TC-11	Statistics Update Tested	Updated match performance is correctly reflected in the player's overall statistics.	Tested
TC-12	Reports	Player performance reports display relevant statistics and calculated information.	Tested
TC-13	Dashboard	Dashboard components correctly display available player and match performance data.	Tested
TC-14	Performance	Application pages, searches and reports respond within an acceptable time under normal usage.	Checked

6.3 Validation Testing

Validation testing covers mandatory fields, data formats, statistical values and input ranges. The purpose is to prevent incomplete, incorrect or invalid player and match records from being accepted by the CRICKSTATS application.

Player names, team details, match information, runs, wickets, overs and other statistical values are checked during validation. Invalid values are identified and appropriate messages are displayed to the user. The validation process helps maintain the accuracy and consistency of cricket performance records.

The system also checks whether required information is entered before saving a record. This prevents incomplete data from affecting player performance calculations and reports.

6.4 Functional And Access Testing

Functional testing covers the major features and modules of the CRICKSTATS application. The system is checked to ensure that player registration, player profiles, team information, match records, batting statistics, bowling statistics, search functionality and performance tracking work according to the specified requirements.

Access testing verifies that users can access the available application features properly. The system is checked to ensure that users can navigate between different modules and view the required player and performance information.

The application is also tested for correct handling of invalid inputs and unexpected operations. Appropriate validation messages are displayed whenever incorrect information is entered.

6.5 Performance And Analytics Testing

Performance testing is carried out to check the response time, processing speed and stability of the CRICKSTATS application. Player records, match statistics and performance data are processed to verify that the application provides results without unnecessary delays.

Search operations are tested using different player records to check whether the required information is retrieved efficiently. Performance calculations are also checked to ensure that batting and bowling statistics are processed correctly.

Reports and dashboards are tested to verify that they display the latest available player and match data. When new match information is added, the corresponding player statistics and performance information should be updated correctly.

The following performance aspects are considered:

- Application loading time.
- Player search response time.
- Player profile retrieval.
- Match data processing.
- Batting and bowling calculation time.
- Dashboard loading.
- Report generation.
- Handling of multiple player records.
- Stability during continuous usage.

The performance testing ensures that CRICKSTATS remains responsive and provides users with cricket statistics efficiently.

6.6 Testing Conclusion

The testing phase covers the core functional, validation, performance and analytics areas of the CRICKSTATS – Cricket Player Performance Tracking Application. The documented test cases provide evidence that player records, team information, match details, batting and bowling statistics, search functions, reports and dashboards have been reviewed against the project requirements.

Functional testing confirms that the major features operate as expected, while performance testing checks the response and processing efficiency of the application. Validation testing helps maintain accurate and consistent cricket records.

Overall, the testing process helps identify and correct errors before the final implementation of the application. The completed testing ensures that CRICKSTATS provides reliable player performance tracking, accurate statistical information and a smooth user experience.
